Q1. DICTIONARY

ANSWER

Generally dictionary used key values for searching the elements Whereas list uses the integers in square brackets [] to search the elements. Dictionaries are faster for searching an element than list.

Q2. SET

ANSWER

SET IS A MAIN CONCEPT IN PYTHON USED TO READ AND WRITE A GROUP OF ELEMENTS IN A SET. THE MAIN PROPERTIES ARE UNION, INTERSECTION, DIFFERENCE, DISJOINT & JOINT. SET IS IMMUTABLE. GENERALLY SET IS DENOTED BY "set()". WE KNOW THAT SETS DO NOT ALLOW DUPLICATE ELEMENTS BECAUSE SETS REPRESENTS EACH ELEMENT ONLY ONCE AT A TIME. SET AUTOMATICALLY SORT THE ELEMENTS IN ASCENDING ORDER. IT ALWAYS REMOVE THE DUPLICATE ELEMENTS.

Q3. Tuple

ANSWER

```
n=(1,2,3,4,5)
a,b,*c=n
print(a)
print(b)
print(c)
```

OUTPUT:
a=1
b=2
c=[3,4,5]

Q4. DICTIONARY

ANSWER

Generally we use dictionary for accessing elements using key values. But this is not possible in list or set. We can access the list or set are access only by using square brackets []. So we use dictionary to access the same function repeatedly using key values which was assigned by us which was not possible in set or list.

Q5. DICTIONARY

ANSWER

Dictionary is also known as hash map. It is mutable. It stores data strictly in the Key-value pairs. Generally it stores key values in the curly braces {}. Hashing is the process of converting an arbitrary size input into a fixed size.
